

Week of DevOps – Mondays

Richard Seroter

SENIOR DIRECTOR OF PRODUCT, PIVOTAL

@rseroter

Overview

The value of team standups

Using on-call engineer rotations

Planning software sprints

How to review new software requests

Merging and testing code constantly

Summary

What is it?

Org/team standup

Who is involved?

Team members, interested parties

Why does it belong in DevOps?

Transparency, throughput, delivery focus

Why a Daily Standup Matters

Orient everyone

**Draw attention to
important info**

**Come together
to remove
blockers**

**Facilitate
continuous
improvement**

Tips for Getting Started

Set up a shared calendar with milestones

Keep brief, avoid status updates

Don't force everyone to speak

Set an example that asking for help is ok

What is it?

Assign on-call engineer

Who is involved?

Rotating person on the application team

Why does it belong in DevOps?

Develops empathy, focus on the customer

On-call Engineer Leads to Better Code, Focus

Puts the focus
on the customer
and the service

Encourages code
instrumentation,
improvement

Helps other
team members
stay focused

Record of
experiences
help the team

Tips for Getting Started

Sign up for pager service

Make it easy to find who is on-call

Do dry-run exercises to flex the process

Add an “executive on-call” to the rotation

What is it?

Plan next sprint

Who is involved?

Whole application team

Why does it belong in DevOps?

Focus on small batches, delivery pipeline

Key Part of DevOps Is the Sprint Approach

Product owner
maintains backlog

Start meeting with
retrospective

Team decides amount
of work in sprint

Sprint scope
doesn't change

Team always ships at
the end of a sprint

Sprint window should
keep shrinking

Tips for Getting Started

Designate a product owner

Begin with one month sprints

Don't use planning session to design

If add work, subtract work from sprint

Change process regularly to improve

What is it?

Triage new feature requests

Who is involved?

Product owner, stakeholders

Why does it belong in DevOps?

Continual improvement, customer focus

Do Realistic Reviews of New Requests

Review all software requests regularly

Cross-functional participation

Immediately adjust backlog priorities

Tips for Getting Started

Triage features **AND** bugs in this meeting

Support team, on-call engineers attend

Reject the majority of requests

Product owner retires old backlog items

What is it?

Merge code with the master branch

Who is involved?

All engineers

Why does it belong in DevOps?

Small batches, limited work-in-progress

Continuous Integration Drives Confidence

Test coverage is
key to trusting
automation

Fast feedback
reduces wasted
time later on

Frequent tests
mean smaller
debugging surface

Aim for green
builds, don't
fear red

Tips for Getting Started

Source control repository is a must-have

Get visual indicators of build status

Avoid long-lived feature branches

Make working code a forcing function
