

Risk Exercise

For this project, as you currently understand it and what you know so far about Agile Project Management, use the 8 Principles and the Project Approach Questionnaire (PAQ) to identify risks.

- Identify your 3 biggest risks to using an Agile approach.
- For balance, also identify the key risks of choosing a traditional approach to project management on this project.

Exercise objectives:

Successful Agile is about preparing as much as possible in the early stages. Often the situation is less than perfect, and being clear about where the risks lie and how these may be managed is key.

Remember the risks are about the implementation of Agile Project Management - not generic risks which would be the same no matter what project management approach is used - the purpose of this task is to identify risk. You will return to this task in later modules to look at what risk mitigation you would suggest.

AGILE PASSPORT

Module 4 – PAQ Task

Project:	
Date:	

Name:	
Position:	

AgilePM - Project Approach Questionnaire		Indicate the closest collective opinion					Where appropriate, comment on issues or risks related to a more negative response to this aspect of the DSDM Atern approach
Ref	Statement	Strongly Agree	Agree	Neutral	Disagree	Strongly Disagree	
1	The business driver behind the project is clearly stated and is visible to all members of the project team						
2	The Business Sponsor and/or Business Visionary demonstrate clear ownership of the project.						
3	The Business Sponsor, Business Visionary and Technical Coordinator all understand and accept the DSDM Atern philosophy						
4	The development has a clearly-defined timescale						
5	The requirements can be prioritised and there is flexibility to accept that not all requirements are 'Must Have' requirements						

Module 4 – PAQ Task

6	Requirements have been defined at a high level at the outset of the project, and it is acknowledged that changes are likely during development						
7	It is accepted that the detail of both the requirements and the solution will emerge as the project progresses						
8	The Business Sponsor and Business Visionary are aware of the importance of active business involvement and have the willingness and authority to commit appropriate business resources to the project as required.						
9	The Business Ambassadors are sufficiently empowered to guide the day to day evolution of the solution						
10	The Solution Developers are sufficiently empowered to provide the best solution they can from a business perspective within pre-agreed architectural constraints.						
11	Solution development resources are allocated at an appropriate level and the team will be largely stable throughout the project (or, at least, throughout each increment).						

Module 4 – PAQ Task

12	The Project Team and Solution Development team are able to adopt the roles and responsibilities within DSDM						
13	It will be possible for the Solution Developers to have easy access to Business Ambassadors and Business Advisors throughout the project.						
14	The Solution Development team (including both business and solution development resources) will have the appropriate collective knowledge and/or technical skills to deliver the solution.						
15	The Solution Development team (including both business and solution development resources) will have the appropriate soft skills (communication, negotiation etc.) to work effectively with each other and those around them.						
16	Strategies for continuous communication and collaborative working practices are sufficient to clearly support iterative development of the solution						
17	The development technology tools and techniques support an iterative approach to solution development						

18	There are no technical, contractual or other constraints to prevent the solution being broken into increments for development and delivery (even if the products of such increments are not deployed immediately)						
19	All project participants understand and accept that on-time delivery of an acceptable solution is the primary measure of success for the project						
20	All parties accept that continual assessment of the fitness for purposes of all deliverables during development is essential						
21	There are no mandatory standards or practices in force that will work against the evolution of a solution from a baselined set of high level requirements
